TYPING SPEED TESTER

Measure speed, sharpen skills

GOALS

1

To implement character input, timing functions, and word comparison in C and assembly to measure typing speed accurately.

2

To use interrupts, registers, and low-level routines to handle keyboard input and display results, reinforcing our assembly learning.

3

Create a clean, menu-driven interface that shows words per minute, accuracy percentage, and progress after each test.

PROJECT OVERVIEW

What it is

This project is a small program that checks how fast and how correctly a person can type.

How it works

The user chooses a mode: typing a paragraph or copying code.
A timer runs for 60 seconds.
The user types the given text.
At the end, the program shows results.

What it shows

Total words typed
Correct and wrong words
Accuracy percentage
Words per minute (WPM)

Why we made it

It helps people practice typing, improve speed, and learn to type more accurately.

METHODOLOGY

1

Planning:
We decided to make a program that checks typing speed and accuracy. We chose two modes: paragraph typing and code copying

2

Coding:
We wrote the main program in C for menus, input, and results. We also used assembly for timer, string length, string compare, and WPM calculation.

3

Testing:
We ran the program, typed the given text, and checked if the results were shown properly.

RESULT

SAMPLE OUTPUT

```
TIME UP!
RESULTS

-------
Fine :The
Fine :sun
Fine :shines
Fine :bright

Total Words  : 4
Correct      : 4
Wrong        : 0
Accuracy     : 100%
WPM          : 4

Press ENTER to go back...
```

CONCLUSION

The Typing Speed Tester project helped us learn how to combine C and Assembly to make a working program. It checks typing speed and accuracy in a fun way, with options for typing paragraphs or code. By showing clear results like words per minute and accuracy, the project gives users a chance to practice and improve. Overall, this project was a good way to understand programming concepts while building something useful.

The code typing option was added so users can also practice typing special characters and programming syntax. This makes the project more useful for learners who want to improve both general typing and coding accuracy.

THANK YOU
